Depression: Seasonal Affective Disorder

What is Seasonal Affective Disorder?

Some people suffer from symptoms of depression during the winter months, with symptoms subsiding during the spring and summer months. This may be a sign of Seasonal Affective Disorder (SAD). SAD is a mood disorder associated with depression episodes and related to seasonal variations of light.

SAD was first noted before 1845, but was not officially named until the early 1980's. For centuries, sunlight has peaked and ebbed throughout the year, affecting the seasonal activities of animals (i.e., reproductive cycles and hibernation). SAD may be an effect of this seasonal light variation in humans. As seasons change, there is a shift in our "biological internal clocks" or circadian rhythm, due partly to these changes in sunlight patterns. This can cause our biological clocks to be out of "step" with our daily schedules. The most difficult months for SAD sufferers are January and February, and younger persons and women are at higher risk.

Symptoms Include:

- Regularly occurring symptoms of depression (excessive eating and sleeping, weight gain) during the fall or winter months.
- Full remission from depression occurs in the spring and summer months.
- Symptoms have occurred in the past two years, with no seasonal depression episodes.
- Seasonal episodes substantially outnumber no seasonal depression episodes.
- A craving for sugary and/or starchy foods.

Possible Cause of this Disorder

Melatonin, a sleep-related hormone secreted by the pineal gland in the brain, has been linked to SAD. This hormone, which may cause symptoms of depression, is produced at increased levels in the dark. Therefore, when the days are shorter and darker the production of this hormone increases.

Treatments

Phototherapy or bright light therapy has been shown to suppress the brain's secretion of melatonin. Although, there have been no research findings to definitely link this therapy with an antidepressant effect, many people respond to this treatment. The device most often used today is a bank of white fluorescent lights on a metal reflector and shield with a plastic screen. For mild symptoms, spending time outdoors during the day or arranging homes and workplaces to receive more sunlight may be helpful. One study found that an hour's walk in winter sunlight was as effective as two and a half hours under bright artificial light.

If phototherapy doesn't work, an antidepressant drug may prove effective in reducing or eliminating SAD symptoms, but there may be unwanted side effects to consider. Discuss your symptoms thoroughly with your family doctor and/or mental health professional.

Mental Health America of Franklin County is a private, not-for-profit organization, established in 1956. We help people navigate the mental health system. We are dedicated to promoting mental health in Franklin County through advocacy, education, and support services. Our programs include: information and referral to community mental health and alcohol/drug services; free support groups for people with mental illness and their families; an Ombudsman program that assists clients in navigating the mental health and alcohol/drug system; mental health screenings in English and Spanish; Pro Bono Counseling Program where underinsured and uninsured individuals can receive free counseling; community and professional mental health education including Get Connected; maternal mental health support and advocacy (POEM); and a quarterly newsletter featuring legislative updates and new happenings at MHAFC. We receive funding from the Franklin County ADAMH Board, United Way of Central Ohio, individuals, foundations, and corporations. To become a member or find out more information, please visit us online at www.mhafc.org.
